Do we have a functional spec of who the users are and what they can do on each app?

Yes, a functional spec for Project Hyena includes *who the users are* and *what they can do on each app*:

User Roles and Core Capabilities by Interface

1. Guest Self-Service Portal (Mobile/Web)

Role: Hotel Guest
Capabilities:

- Self-diagnose connectivity issues (guided troubleshooting wizard)
- Report detailed problems (select issue, describe, add photos)
- Track issue status and technician assignment in real time
- Receive push/in-app notifications about network status/maintenance
- Provide post-resolution feedback and satisfaction surveys
- View educational content, network tips, performance indicators
- Optionally escalate unresolved issues to staff

2. Property Management Dashboard (Desktop/Web)

Role: Hotel Manager/Front Desk/IT Coordinator
Capabilities:

- Monitor live network health and property performance
- View and manage the incident queue (active issues, priority sorting)
- Assign technicians to incidents with automatic skill/location matching
- Communicate directly with guests (status, solutions, follow-ups)
- Analyze business impact (revenue risk, guest satisfaction, occupancy metrics)
- Export reports and performance analytics
- Schedule maintenance/events and manage VIP/network requirements
- Detect incident patterns and plan preventive actions

3. Platform Administration Center (Desktop/Web)

Role: Multi-Property Administrator/Strategic Manager
Capabilities:

- View multi-property dashboard (health, alerts, aggregate metrics)
- Benchmark properties, perform cross-property pattern analysis
- Identify and coordinate responses to systemic/regional issues
- Forecast resource demand and optimize technician deployment
- Manage compliance, integration health, system configuration, and user roles
- Drill down from KPIs to detailed event history, automate reporting
- Escalate vendor issues (such as support tickets to HPE)

4. Technician Mobile Application (Mobile/Tablet)

Role: Field Technician/Engineer
Capabilities:

- Receive incident/job assignments via push notification or work queue
- View incident details (location, device, diagnostics, guest info)
- Access diagnostics, real-time network/device data
- Navigate to location using GPS support
- Perform and confirm maintenance tasks, upload documentation (photos, voice notes)
- Status update/resolution confirmation, time tracking for each work order
- Access preventive maintenance schedule and prior resolutions
- Submit field learning to knowledge base

5. Admin Configuration UI (Web)

Role: System Administrator/Implementation Engineer
Capabilities:

- Apply and manage white-label branding (themes, logos, assets)
- Configure system-wide settings, access controls, notifications
- Set up user roles, permissions, and access policies
- Manage environment-specific configuration for client deployments
- Schedule system maintenance, customize documentation and demo data

Summary:

- Guests can self-troubleshoot, report, track, and provide feedback.

- Managers see and manage all property incidents, assign techs, communicate, and run analytics.
- Admins oversee portfolio health, optimize resources, and handle compliance.
- Technicians resolve incidents on-location and document solutions.
- System Admins configure the platform for clients and manage roles and branding.

Each app is designed with specific user flows, permissions, and notification types, ensuring all users only access what's needed for their role while supporting cross-interface communication, monitoring, and resolution. If you'd like, a user-interface feature matrix or access control schema can also be provided.[1] [2] [3]
