Please help me create a UX and UI specification. This app is to be whitelabelled so it can be implemented for different cleints. Clearly simplicity clarrity are very important., Events need to be front and centre. Pelase expand this into a UX and UI spec

Below is a comprehensive UX and UI specification for Project Hyena, optimized for white-label delivery, simplicity, and clarity. Events and actions remain the focal point across all interfaces, supporting seamless adoption by different hospitality clients.

Project Hyena: UX & UI Specification

White-Label Design Principles

- **Centralized Theme Management:**
  All colors, typography, and spacing are managed via configurable theme tokens—supporting instant branding for each client without code changes.
- **Asset Swapping:**
  Logo, favicon, app icons, and all branded graphics are externally configurable for each deployment.
- **Configurable Terminology:**
  Application names, section labels, and communication templates use placeholders to support property- or brand-specific language.
- **Multi-Tenant Ready:**
  Quick switchover in demo environments for rapid brand demonstration and client evaluation.

Global UX Foundations

- **Simplicity First:**
  - Only essential information and controls are surfaced by default.
  - Interfaces provide progressive disclosure, revealing advanced features/context as users engage.
- **Event-Centric:**

    - Events are always visually prominent—immediate incident status, new alerts, and action items are at the top of every home/dashboard view.
    - Role-based, contextual surfacing (what each user sees is tied to their responsibility and authority).
- **Clarity & Cognitive Ease:**
    - Consistently large, readable font sizes.
    - Sufficient breathing room and whitespace between elements.
    - Clear iconography and color contrast (AA or better compliance).
- **Feedback & Confirmations:**
    - All major actions (report, assign, resolve, escalate) provide immediate visual confirmation (toast, modal, inline feedback).
- **Mobile-First & Responsive:**
    - Guest and technician flows are optimized for mobile, with adaptive layouts for all breakpoints on all interfaces.
- **Accessibility:**
    - Minimum compliance with WCAG 2.1 AA.
    - Keyboard navigation, screen-reader labels for all interactive objects, scalable text.

Event Surfacing: Common UI Patterns

- **Event Cards:**
    - Reusable, brand-themable event components used throughout (queue, dashboard, status).
    - Cards highlight priority, status, timestamp, and key context at a glance.
- **Persistent Notification Center:**
    - Always-available alert list by priority with easy filtering.
- **Unified Status Bar:**
    - Core events and next actions always displayed at top or bottom of app window/mobile device.

Interface-Specific UX/UI Standards

1. Guest Self-Service Portal

- **Home/Welcome:**
    - Single call-to-action for connectivity check.
    - Current issue status (e.g., "Network health: 1 incident in your area") and last update indicator.

- **Troubleshooting Wizard:**
  - Stepwise, illustrated guidance.
  - Device and location selector.
  - Automatic advancement when tests succeed or next step is triggered.
- **Issue Reporting:**
  - Category, severity, description, and optional image upload—minimal required at first step.
- **Feedback Modal:**
  - Transactional (post-resolution) and persistent (in-app) feedback entry.

2. Property Management Dashboard

- **Default View:**
  - Prominent incident queue; highest-impact events first.
  - Live network map with severity/presence overlays.
  - Key business impacts, guest satisfaction, and at-risk revenue widgets.
- **Incident Console:**
  - Multi-select, bulk assign, status update controls.
  - Communication tools (guest messaging, escalation).
- **Analytics & Reports:**
  - Simplified trend views, download/export, drill-down on segments.
- **Customizable Columns:**
  - Optional columns by user role or segment (accessible via settings).

3. Platform Administration Center

- **Portfolio Overview:**
  - Aggregate event status and high-level KPIs.
  - Property map with status color and alert count.
- **Resource Management:**
  - Technician/Inventory tracker, drag-and-drop assignment.
- **Event Drilldown:**
  - Breadcrumb navigation from summary to event detail.

4. Technician Mobile App

- **Work Queue:**
  - Swipeable event cards for quick triage/assign/complete.
  - Push notification for new/critical incidents.
- **Incident Detail:**
  - Clear checklist or stepper for repairs and testing.
  - Single-tap photo/evidence logging.
- **On-Site Tools:**
  - Device map/navigation.
  - Real-time network and equipment diagnostics.

Component Architecture & Theming

- **Reusable Modular Components:**
  - All forms, event cards, buttons, notification panels, and navigation elements are built as composable units.
- **Theme Tokens:**
  - All visual tokens (color, type, spacing, radii) are brand-configurable.
- **No Inline Styles:**
  - All styles are in external style modules/CSS-in-JS, inheriting from theme.
- **Brandable Email/Notification Templates:**
  - Customizable via config file (headers, greetings, signoffs, logo).

Event Workflow Patterns (UX)

- **Creation:**
  - Direct UI input, API call, or sensor/system event.
- **Acknowledgment:**
  - Immediate visual notification and action bar update.
- **Processing:**
  - Color/priority changes reflect triage; status is always visible.
- **Resolution:**
  - Completed/closed leaves persistent trace but is moved to success/read-only area and triggers feedback prompt.
- **Error/Edge Cases:**
  - Full-screen errors for outages, inline error banners for partial degradation.

- **Role-Based Escalation Paths:**
  - Only actionable routes/context/options are clickable for a user's assigned role.

Documentation & Accessibility for White-Label

- Full theming guide for implementers:
  - List of token names, value formats, asset specs.
- Logo/icon spec:
  - PNG/SVG, recommended sizes, placement locations.
- Demo data guidelines:
  - Generic hotel/event data, no actual client names.
- Hand-off checklists:
  - Templates for brand QA, client onboarding, training materials.

Simplicity & Clarity Checklist

- No informational overload: All screens are limited to essential event data and most frequent actions.
- One main action per view where feasible (e.g., “Report Issue,” “Assign Technician”).
- Color, iconography, and notification patterns are consistent across roles and interfaces.
- Live feedback (status change, confirmation) is always instant and visual.

This specification gives UI/UX designers, developers, and implementation partners the clarity and flexibility to create a branded, event-centric, and client-friendly interface for Project Hyena, with events front-and-center and user journeys streamlined for speed, mobile use, and clarity.Here is an expanded UX and UI specification for Project Hyena—optimized for white-label delivery, event-centricity, and exceptional clarity and simplicity across all screens:[1] [2] [3]

Project Hyena UX & UI Specification

White-Label UX Foundation

- **Centralized branding system:** All color, typography, and layout tokens set via a client theme config file—no inline styles.
- **Brand asset swap:** Logo, favicon, app icon, and visual elements are external, per-client assets.
- **Multi-tenancy & rapid demo:** Switch branding instantly for demos or multiple client environments.

Principles & Patterns

- **Event-first:** All key screens feature prominent event cards, banners, or notification centers.
- **Simplicity:** Limit visible controls and data to what's needed for each role step; progressive disclosure for advanced/secondary actions.
- **Clarity:** Strong use of whitespace, consistent headers, clear icons and color.
- **Consistent feedback:** Success/error banners appear after all critical actions; toast/notification for non-blocking updates.
- **Mobile-first:** Guest and technician paths designed for one-handed use and immediate visibility/action.

Event UI Patterns

- **Event card/component:** Themed by event type and priority; shows status, action needed, timestamp, and summary.
- **Global notification center:** Pull-down or always-visible sidebar for alerts, with filter by status/priority.
- **Unified status bar:** Current network state/incidents presented at top/bottom of interface at all times.

By Interface

Guest Self-Service Portal (Mobile-first)

- Home: Call-to-action "Test My Connection." Shows event banners if detected.
- Troubleshooting: Wizard UI with illustrations, large progress indicators, and clear affordances.
- Report Issue: Minimal form—type dropdown, room/location, optional image upload, tap-to-complete.
- Status view: Track progress ("Assigned Technician: John, Est. 15 min").
- Feedback: Modal dialog triggered on ticket closure, with rating/comments.

Property Management Dashboard (Desktop)

- Incident queue: List/table of event cards sorted by impact/urgency.
- Map view: Dynamic property map, color-coded by zone status.
- Analytics: Trendline and aggregate widgets (guest impact, revenue at risk, etc.).
- Assign/Communicate: Bulk or single-incident assignment and direct guest/staff comms from any incident card.

Platform Administration Center

- Multi-property map grid: Visual indicators for health/event state at each property.
- Benchmarks: KPI dashboard; drill-down with breadcrumb nav.
- Resource allocation: Drag-and-drop tech assignment, status/tracking table.

Technician Mobile App

- Worklist: Card stack/swipe or scroll queue; new/high-priority at top.
- Incident detail: Map/GPS to location, quick logs, next steps/checklist; photo button one tap away.
- On-site tools: Real-time device data, rapid checklists, time/part tracking.

Component/Style Guidelines

- **All controls and interactive icons sized for mobile accessibility**
- **No inline styles:** All layout, color, and typography from external brand tokens.
- **Role-based navigation:** Each role only sees features/actions they are responsible for; no cross-role clutter.
- **All notification and feedback patterns are consistent and branded**

Documentation for Implementation

- **Theming instructions:** Token list, usage examples, recommended color/contrast pairings.
- **Asset guide:** Logo/icon specs, image size, export formats.
- **Demo dataset guidelines:** No real brand or sensitive guest data in demo.
- **Test/QA handoff:** Event reporting to be validated for every role; color and label review against theme.

Summary:
Project Hyena UX/UI is white-label and component-based, keeps events as the core user experience, and was built for absolute clarity, simplicity, and brand flexibility. Anyone prototyping or implementing the system will have a clear, actionable blueprint that supports world-class hospitality support.[2] [3] [1]
