Include in the spec for replit please

Certainly! Here's the finalized functional specification for Project Hyena's prototype, now including the **comprehensive event taxonomy** inside the shareable document for collaborative prototyping in Replit.[1] [2] [3] [4] [5] [6] [7]

Project Hyena Functional Specification

Prototype Edition – For Replit Development

Overview

Project Hyena is a proactive, event-driven network monitoring platform for hotels. It integrates with HPE APIs and delivers real-time incident detection, status tracking, troubleshooting, multi-role communication, and feedback capture through four distinct user interfaces. The solution supports full white-label customization and regional adaptation.

System Architecture

- **Single Application**: Four modules—Guest Portal, Management Dashboard, Admin Center, Technician App
- **Event-Driven**: All features operate through unified event creation, handling, and resolution across interfaces and roles

Complete Event Catalogue

Platform-Generated Technical Events

- Device/AP Offline
- High CPU/Memory Usage
- Unauthorized/Failed Configuration Change
- Authentication Failures
- Bandwidth Threshold Breach
- Security/Rogue Device Detected
- Firmware Update Required

- License Expiry Notification
- Infrastructure/Hardware Health Alert
- Capacity Warning
- Performance Degradation
- Environmental Alert (temperature, power, cooling)
- Backup Failure
- Scheduled Maintenance Notification
- Connection Quality Drop
- Coverage Gaps
- Voice/Video Quality Issues
- Roaming Failure

Guest-Initiated Events

- Wi-Fi Not Working
- Slow Internet
- Can't Connect Device
- Dropped Calls
- Streaming Problems
- Gaming Lag
- Work VPN Issues
- Status Check
- Speed Test Request
- Coverage Question
- Device Limit Question
- Password Request
- Guest Check-in Event
- Event Preparation
- Checkout Feedback
- Compliments, Suggestions, Complaints
- Satisfaction Survey
- Escalation Request / Follow-up

Management/Operations Events

- Guest Complaint Logged
- Incident by Staff
- Conference/Event Planning Trigger
- VIP Arrival
- Housekeeping Equipment Network Report
- Maintenance Request (scheduled/emergency)
- Capacity Planning
- Daily Health/Weekly Review
- Incident Pattern/Cost/Competitive Analysis
- Emergency (Power, weather, mass complaint, security breach)

Platform Administration Events

- Multi-property System Alert
- Regional Performance/Trend Issue
- Strategic Planning/Budget/Capacity Review
- Vendor Escalation
- System Configuration Update
- User Role/Permission Management
- Compliance/Audit Trigger
- API/Integration Health Event

Technician/Field Service Events

- Incident Assignment/Work Order
- Arrival/Check-in
- Equipment/Parts Request
- Completion/Documentation
- Preventive Maintenance Scheduling
- ISP/Utility Alert
- Construction/Weather/External Event
- Knowledge Base Update

Environmental, Scheduled, Predictive Events

- Power Outage/Load Shedding (scheduled or unplanned)
- Severe Weather (storm, flood, temperature, lightning)
- Utility Outage (water, HVAC)
- Construction/Renovation Event
- Holidays/Public Events (occupancy/network surge)
- Local Gatherings (festival, conference, sporting, rallies)
- Usage Spike Prediction
- Scheduled Health/Review/Report
- Preventive Maintenance Trigger

User Feedback, Satisfaction, Sentiment Events

- In-App Survey / Feedback Prompt
- Incident Resolution Rating
- Service Quality Feedback (network, amenities, staff)
- Net Promoter Score (NPS)
- Compliments, Suggestions, Complaints
- Third-Party Review Invitation
- Sentiment/Trend Detection

APIs & Data Sources

- Aruba Central API
- GreenLake API
- UXI API
- PMS API
- Utility Provider API
- Weather API
- ISP Notification API
- Survey/Feedback API
- Admin Configuration API

User Interfaces & Roles

- Guest Self-Service Portal (mobile/web)
- Property Management Dashboard (desktop/web)
- Platform Administration Center (desktop/web)
- Technician Mobile App (mobile/tablet)
- Admin Configuration UI (web)

Event Lifecycle

Step	Description
Event Trigger	Initiated by API, user input, scheduled, or external alert
Processing (Hyena Engine)	Classifies, correlates, enriches, prioritizes, and routes
Communication	Notifies and displays to one/more interfaces (dashboard, mobile, portals, admin)
Resolution	Assigns technician, guides guest, enables staff response, closes incident, records feedback

Core Data Models

Event

- event_id
- type
- priority
- source
- timestamp
- related_entity

Notification

- notification_id
- event_id
- interface_type
- message
- timestamp

User

- user_id
- role

- contact info
- preferences

Action

- action_id
- event_id
- type
- assigned_to
- status
- timestamps
- notes

Module Requirements

- Modular, role-based UI components
- Configurable white-label branding
- Mock APIs/local datasets for simulation
- Centralized event state and notification logic
- Real-time update simulation (polling/timers/websockets)
- Unified login/session context

API Sample Endpoints

- GET `/network-events`
- GET `/device-status`
- POST `/incident-report`
- POST `/assign-task`
- POST `/guest-feedback`
- GET `/status-tracking`
- POST `/admin-config`
- GET `/weather-alerts`

Implementation Guidance for Replit

- Use modular front-end stack (React/Vue/Svelte)
- Store mock demo data in JSON or use Replit DB
- Simulate event flow with timers or sockets

- Organize code by interface/module
- Document endpoint and data payload formats

This document is designed for sharing with development and design teams on Replit, providing full clarity for rapid interface prototyping, integration storyboarding, and demo-ready builds.Here is the finalized functional specification for your Replit prototype, now containing **the full researched event catalogue** you requested for Project Hyena.[2] [3] [4] [5] [6] [7] [1]

Project Hyena – Functional Specification (Replit Edition)

Overview

A proactive network monitoring platform for the hospitality industry, supporting real-time event flows, cross-role communication, troubleshooting and analytics via four interconnected interfaces: Guest Portal, Management Dashboard, Admin Center, and Technician App. All features are architected to support white-label branding and regional adaptation.

System Modules

- Guest Self-Service Portal (mobile/web)
- Property Management Dashboard (desktop/web)
- Platform Administration Center (desktop/web)
- Technician Mobile App (mobile/tablet)
- Admin Configuration Interface (web)
- Key APIs: Aruba Central, GreenLake, UXI, PMS, Utility Provider, Weather, ISP, Feedback/Survey, Admin Config

Event Catalogue

Platform-Generated Technical Events

- Device/AP Offline (Aruba Central, UXI)
- High CPU/Memory Usage
- Unauthorized/Failed Configuration Change
- Authentication Failures
- Bandwidth Threshold Breach
- Security/Rogue Device Detected
- Firmware Update Required
- License Expiry Notification
- Infrastructure/Hardware Health Alert (GreenLake)

- Capacity Warning
- Performance Degradation
- Environmental Alert (temperature, power, cooling)
- Backup Failure
- Scheduled Maintenance Notification
- Connection Quality Drop (UXI)
- Coverage Gap (UXI)
- Voice/Video Quality Issue (UXI)
- Roaming Failure (UXI)

Guest-Initiated Events

- Wi-Fi Not Working
- Slow Internet
- Can't Connect Device
- Dropped Calls
- Streaming Problems
- Gaming Lag
- Work VPN Issues
- Status Check
- Speed Test Request
- Coverage Question
- Device Limit Question
- Password Request
- Guest Check-in Event
- Event Preparation
- Checkout Feedback
- Compliments/Suggestions/Complaints
- Satisfaction Survey
- Escalation Request / Follow-up

Management/Operations Events

- Guest Complaint Logged
- Incident Logged by Staff
- Conference/Event Planning Trigger
- VIP Arrival

- Housekeeping Equipment Issue
- Maintenance Request (scheduled/emergency)
- Capacity Planning
- Daily/Weekly Health Review
- Incident Pattern/Cost Analysis
- Competitive Benchmarking
- Emergency (power outage, weather, mass complaint, security breach)

Platform Admin Events

- Multi-Property Alert
- Regional Issue or Trend
- Strategic Planning/Budget/Capacity Review
- Vendor Escalation
- System Configuration Change
- User/Role Management
- Compliance/Audit Trigger
- API/Integration Health Event

Technician/Field Events

- Incident Assignment/Work Order
- Arrival/Check-in
- Parts/Equipment Request
- Resolution Documentation
- Preventive Maintenance Check/Schedule
- Field Documentation (photo/video, voice note, KB update)
- ISP/Utility Alert
- Construction/Weather/External Notification

Environmental/Scheduled/Predictive Events

- Load Shedding / Power Outage (scheduled/unplanned)
- Severe Weather (storm, flood, extreme temp, lightning)
- Utility Outage (water/HVAC)
- Construction/Renovation Event
- Holiday/Public Event (occupancy/network peak)
- Major Gathering (festival/sport/conference)

- Usage Spike Prediction
- Scheduled Health/Review/Report
- Predictive Maintenance Alert

User Feedback/Satisfaction Events

- In-App Survey/Feedback
- Incident Satisfaction Rating
- Net Promoter Score (NPS)
- Service/Staff Feedback
- Compliment/Suggestion/Complaint
- Third-Party Review Prompt
- Sentiment/Trend Analysis Event

Event Lifecycle

- Trigger (API, user input, scheduled/external event)
- Hyena Engine: classifies, correlates, enriches, prioritizes, routes
- Surfacing: notification, dashboard, ticket, push alert to relevant interface(s)
- Resolution: technician assignment, troubleshooting, staff response, feedback, closure

Core Data Models (simplified for prototyping)

- Event: {id, type, priority, source, timestamp, related_entity}
- User: {id, role, contact, preferences}
- Notification: {id, event_id, interface_type, message, timestamp}
- Action: {id, event_id, type, assigned_to, status, timestamps, notes}

API Example Endpoints

- GET `/network-events`
- GET `/device-status`
- POST `/incident-report`
- POST `/assign-task`
- POST `/guest-feedback`
- GET `/status-tracking`
- GET `/weather-alerts`

Prototype Requirements

- Modular UI components by role/interface
- Configurable white-label branding (theme config/asset upload)
- Mock APIs/local demo JSON
- Central event store and notification system
- Simulated real-time updates (websockets / timers)
- Unified login/session support

This document is now ready for sharing with your Replit prototype team. All researched events and system context are included to support rapid, goal-oriented development. [3] [4] [5] [6] [7] [1] [2]
